

ELENCO DE “I MINERALI DEL SOMMA-VESUVIO”

(aggiornato al gennaio 2007)

Massimo Russo

Istituto Nazionale di Geofisica e Vulcanologia, sezione di Napoli - Osservatorio Vesuviano,
Via Diocleziano n.328, I-80124 Napoli (russo@ov.ingv.it)

Dal settembre 2004 data di pubblicazione del volume di Russo e Punzo: I Minerali del Somma-Vesuvio a cura dell'AMI, lo studio dei minerali del Somma-Vesuvio sia pur lentamente è andato avanti. Nuovo materiale è abbastanza difficile da reperire anche per il divieto di ricerca nell'intera area del Parco Nazionale del Vesuvio; tuttavia riguardando i vecchi campioni relegati in cantina qualche cosa di interessante è venuto fuori.

Attualmente l'elenco dei minerali conta 227 specie valide, 25 dubbie; 61 trovate per la prima volta al mondo al Somma-Vesuvio, località tipo (indicate in *grassetto*) e di queste 5 sono esclusive di questo vulcano (in *grassetto corsivo*), alcune indicate tra “...” si intendono specie valide non totalmente caratterizzate. Rispetto al volume di Russo e Punzo (2004) diverse specie si sono aggiunte all'elenco, ma molte altre sono state depennate in rispetto delle nuove direttive proposte dall'IMA. Qui di seguito si riporta un elenco aggiornato al 5 gennaio 2007. Le formule chimiche sono riprese dal database proposto da Marco Ciriotti (2006).

	Status ¹	Nome	formula chimica	sistema cristallino ²
	A	Actinolite	$\square \text{Ca}_2\text{Mg}_5\text{Si}_8\text{O}_{22}(\text{OH})_2$	mon
	A	Aegirine	$\text{NaFe}^{3+}\text{Si}_2\text{O}_6$	mon
	A	Afghanite	$[(\text{Na},\text{Ca})_{22}\text{Ca}_{10}](\text{Si}_{24}\text{Al}_{24}\text{O}_{96}(\text{SO}_4)_6\text{Cl}_6$	trig

Note:

- Status¹ specie: A = approvata, D = screditata, R = riesaminata, Q = questionabile, G = antenato (specie minerale descritta prima del 1959, cioè prima dell'avvento della Commission on New Minerals and Nomenclature and Classification dell'International Mineralogical Association e pertanto valida fino a dimostrazione contraria).
- Sistema cristallino²: cub = cubico, hex = esagonale, mon = monoclinico, orth = rombico, tet = tetragonale, tric = triclinico, trig = trigonale, nonx = non cristallino invece di amorfo.
- Andesine, screditata = Ca-rich albite (E.A.J. Burke, comunicazione personale su mindat.org, 2006).
- Artroeite, calcioaravaipaite (?), caledonite (?) in Campostrini e Gramaccioli (2005).
- Bytownite, screditata = Ca-rich albite (E.A.J. Burke, comunicazione personale su mindat.org, 2006).
- "Biotite" secondo la nuova nomenclatura proposta da Rieder *et al.* (1998), con il termine "biotite" si fa riferimento ad un nome di serie di miche brune prive di litio, appartenenti a termini diversi: annite-flogopite/siderofillite-eastonite; per tanto è stata eliminata.
- Britholite-(Ce) diventa Hydroxylbritholite-(Ce) (Ciriotti, comunicazione personale)
- Challacolloite in Schlüter *et al.* (2005).
- Cumengeite diventa cumengéite e cambia la formula chimica in Cruciani *et al.* (2005).
- Fluorophlogopite (Steffen Möckel, comunicazione personale di Marco Ciriotti, 2006).
- Fluoromagnesiohastingsite (Steffen Möckel, comunicazione personale di Marco Ciriotti, 2006).
- Gonnardite la formula chimica di questo minerale può anche essere espressa come: $(\text{Na,Ca})_2(\text{Si,Al})_5\text{O}_{10} \cdot 3\text{H}_2\text{O}$ or $\square_x\text{Na}_{16-3x}\text{Ca}_{2x}\text{Al}_{16+x}\text{Si}_{24-x}\text{O}_{80} \cdot n\text{H}_2\text{O}$ ($x=0.3\div3.9$) (in Ciriotti, 2006)
- **Haüyne** diventa haüyne, non più specie località tipo, perché laziale (Marco Ciriotti, comunicazione personale), vedi Bruun-Neergard (1807).
- Hibschite la formula chimica di questo minerale può essere espressa anche come: $\text{Ca}_3\text{Al}_2(\text{SiO}_4)_{3-x}(\text{OH})_{4x}$ ($x=0.2\div1.5$).
- Illite va depennata perché la The Mica Sub committee raccomanda che il nome deve essere usato per una *serie* avente una specifica composizione: $(\text{K,H}_3\text{O})\text{Al}_2(\text{Si}_3\text{Al})\text{O}_{10}(\text{H}_2\text{O,OH})_2$ (comunicazione personale di Marco Ciriotti, 2006)
- Labradorite, screditata = Na-rich anortite (E.A.J. Burke, comunicazione personale su mindat.org, 2006).
- "Levyna" diventa levyna-Na (Alfonso Tarallo, comunicazione personale, 2005).
- Nepheline la formula chimica di questo minerale può anche essere espressa come: $\text{K}_2\text{Na}_6\text{Si}_8\text{Al}_8\text{O}_{32}$ (in Ciriotti, 2006).
- Oligoclasio, screditato = Na-rich anortite (E.A.J. Burke, comunicazione personale su mindat.org, 2006).
- Phillipsite-Ca (Italo Campostrini, comunicazione personale, 2006).
- **Potassic-fluorrichterite** diventa **fluoro-potassicrichterite** a seguito dell'introduzione della nuova nomenclatura sugli anfiboli (Burke *et al.* 2004).
- Pirolusite non confermata meglio indicare le *dendriti* come ossidi ed idrossidi di Mg/Fe.
- Tschermachite è una pargasite ricca in fluoro (Gian Carlo Della Ventura, comunicazione personale, 2006)
- Wollastonite-1A e wollastonite-2M diventano wollastonite (in Ciriotti, 2006)
- "zirconolite" specie riconosciuta, ma non completamente caratterizzata (Russo *et al.*, 2007).
